

(a) No partitioning, $rV = 1$

the whole injected volume dilates the cavity

(b) Computed partitioning, $rV = 11.9$

gas-bearing rhyolite, frozen branch (hypothetical magmatic end-member)

Same injected volume $V_e = 10^5 \text{ m}^3$ and the same vertical scale in both panels. Floor: the uplift in map view; indigo line: map projection of the source's long axis (0.598 km below sea level, plunge 69° , trend 137° ; Di Traglia et al., 2023). $\mu = 1 \text{ GPa}$, $\nu = 0.35$. Uplift computed with the engine's Yang source.
